

Running Windows 7 32Bit on 256MB of Ram

Prince NRVL

You must create a patched winsetup.dll file,
The original file is found in the "sources" folder of the Windows 7 DVD

You will need a Hex Editor, a free version is found here

Code:

<http://www.hhdsoftware.com/Products/home/hex-editor-free.html>

To Start

Open "**winsetup.dll**" with the help of Free Hex Editor Neo

Find **77 07 3D 78 01** string

Replace it with **E9 04 00 00 00** and save the file

Now open the windows 7 32BIT iso with UltraISO or PowerISO

Open the sources folder and replace the "**winsetup.dll**" with the file you just modified

Burn and Run...

This may be useful for some older laptops with less than the standard "512MB" Ram

Thanks/ⁱ

ⁱ Thanks to original creator.
